Module-Level Constructs

──── MODULE M ────

Begins the module or submodule named M.

EXTENDS $M_1, \ldots, M_n$

Incorporates the declarations, definitions, assumptions, and theorems from the modules named $M_1, \ldots, M_n$ into the current module.

CONSTANTS $C_1, \ldots, C_n$ (1)

Declares the C_j to be constant parameters (rigid variables). Each C_j is either an identifier or has the form $C(\_, \ldots, \_)$, the latter form indicating that C is an operator with the indicated number of arguments.

VARIABLES $x_1, \ldots, x_n$ (1)

Declares the x_j to be variables (parameters that are flexible variables).

ASSUME P

Asserts P as an assumption.

$F(x_1, \ldots, x_n) \;\triangleq\; exp$

Defines F to be the operator such that $F(e_1, \ldots, e_n)$ equals exp with each identifier x_k replaced by e_k. (For $n = 0$, it is written $F \triangleq exp$.)

$f[x \in S] \;\triangleq\; exp$ (2)

Defines f to be the function with domain S such that $f[x] = exp$ for all x in S. (The symbol f may occur in exp, allowing a recursive definition.)

(1) The terminal S in the keyword is optional.

(2) $x \in S$ may be replaced by a comma-separated list of items $v \in S$, where v is either a comma-separated list or a tuple of identifiers.

INSTANCE M WITH $p_1 \leftarrow e_1, \ldots, p_m \leftarrow e_m$

For each defined operator F of module M, this defines F to be the operator whose definition is obtained from the definition of F in M by replacing each declared constant or variable p_j of M with e_j. (If $m = 0$, the WITH is omitted.)

$N(x_1, \ldots, x_n) \ \triangleq$ INSTANCE M WITH $p_1 \leftarrow e_1, \ldots, p_m \leftarrow e_m$

For each defined operator F of module M, this defines $N(d_1, \ldots, d_n)!F$ to be the operator whose definition is obtained from the definition of F by replacing each declared constant or variable p_j of M with e_j, and then replacing each identifier x_k with d_k. (If $m = 0$, the WITH is omitted.)

THEOREM P

Asserts that P can be proved from the definitions and assumptions of the current module.

LOCAL *def*

Makes the definition(s) of *def* (which may be a definition or an INSTANCE statement) local to the current module, thereby not obtained when extending or instantiating the module.

Ends the current module or submodule.

The Most Common Standard Modules

Modules *Naturals*, *Integers*, *Reals*

Define	$+$	$-$	$*$	$/$	$\hat{}$	$..$	*Nat*	*Real*
	$\div$	$\%$	$\leq$	$\geq$	$<$	$>$	*Int*	*Infinity*

Prefix $-$ is not defined in *Naturals*.

$a\hat{}b$ denotes a^b.

Nat, *Int*, and *Real* are the sets of naturals, integers, and real numbers.

$a \,..\, b$ equals $\{n \in \mathit{Int} : a \leq n \leq b\}$.

$a \% b$ equals a mod b, defined so $0 \leq a \% b < b$, if b is a positive integer.

$\div$ is defined so $a = b * (a \div b) + (a \% b)$ for a and b integers with $b > 0$.

$/$ (division) is defined only in *Reals*.

Infinity is defined in *Reals* so $-\mathit{Infinity} < r < \mathit{Infinity}$ for all $r \in \mathit{Real}$.

Module *Sequences*

Defines	$\circ$	*Head*	*SelectSeq*	*SubSeq*
	Append	*Len*	*Seq*	*Tail*

The tuple/sequence $\langle e_1, \ldots, e_n \rangle$ equals the function $[i \in 1 \,..\, n \mapsto e_i]$.

$s \circ t$ is the concatenation of sequences s and t.

$\mathit{Append}(\langle e_1, \ldots, e_n \rangle, e_{n+1}) = \langle e_1, \ldots, e_{n+1} \rangle$

$\mathit{Head}(\langle e_1, \ldots, e_n \rangle) = e_1$

$\mathit{Tail}(\langle e_1, \ldots, e_n \rangle) = \langle e_2, \ldots, e_n \rangle$

$\mathit{Len}(\langle e_1, \ldots, e_n \rangle) = n$

$\mathit{Seq}(S)$ is the set of all finite sequences of elements of S.

$\mathit{SubSeq}(\langle e_1, \ldots, e_n \rangle, j, k) = \langle e_j, \ldots, e_k \rangle$

$\mathit{SelectSeq}(s, \mathit{Test})$ is the subsequence of elements e of s satisfying $\mathit{Test}(e)$.

Module *FiniteSets*

Defines *IsFiniteSet* *Cardinality*

$\mathit{IsFiniteSet}(S)$ is true iff S is a finite set.

$\mathit{Cardinality}(S)$ is the number of elements in S, if S is a finite set.
